# The Impact of Financial Technology on Advancing Banking Services and Promoting Financial Inclusion in Libya

Mustafa Etorbi<sup>1</sup>

\*1University of Tripoli, Libya, m.etorbi@uot.edu.ly

Abstract. This research examines the impact of Financial Technology (FinTech) on advancing banking services and financial inclusion in Libya. The study aims to foster financial inclusivity and advance fintech development in Libya, relying on the Innovation Diffusion Theory. Utilizing a quantitative approach in this research, data is collected from Libyan bank customers through structured questionnaires and is analyzed using the Statistical Package for Social Sciences (SPSS). The findings of this research support the hypothesis that the adoption of Alternative Payment Methods (APMs) and automation by banks positively impacts financial inclusion and service quality. The results of this study intend to assist policymakers and financial institutions in devising targeted plans to support Libya's recovery through FinTech, modernizing its banking system, and improving the quality of services offered to citizens. This study informs the debate on developing technology-based mechanisms to tackle the specific banking problems in Libya, improve financial inclusion and assists the key stakeholders by providing them with an elaborate roadmap on enhancing service delivery.

**Keywords:** Financial Technology, Alternative Payment Methods, Automation, Service Quality, Financial Inclusion.

\*Corresponding Author

#### INTRODUCTION

Financial technology, commonly referred to as FinTech, is reshaping the global financial services landscape by improving the efficiency, access, and inclusion of banking services (Josyulam & Expert, 2021; Gomber et al., 2018). The innovation of FinTech like mobile wallets, digital payment systems, and the economical electronic know-your-customer (e-KYC) platforms have helped millions around the world, especially in developing countries with poor banking systems, to avail economical financial services (Arner et al., 2022; Kadaba et al., 2023).

Unfortunately, the cash-based economy, fragmented regulatory frameworks, and poor access to formal financial services stifles the development of the banking sector in Libya (Mohammad et al., 2021). While new initiatives like the mobile wallet and digital payment applications (One

Journal of Islamic Economic Laws Vol. 8 No. 2, 2025 (ISSN P: 2655-9609; E: 2655-9617)

Pay and LyPay) have been introduced, Libyan users engaging in online payments sit at merely

21%, in stark contrast to 33% of cash circulating outside the banking system due to lack of

trust in financial institutions (David & Williams, 2022). These obstacles highlight the pressing

need to investigate the role of FinTech in improving the banking system of Libya and closing

the inclusion gaps for its unbanked population.

Libya's banking inefficiencies are systemically intertwined with conflict, dual central bank

systems, and technological lag (Selmi, 2025). The sector continues to operate with legacy

systems characterized by lengthy waits, slow services, and an inadequate branch network that

does not service rural or economically disadvantaged populations. Although some FinTech

initiatives like instant payments and e-KYC systems are being tested in Libya, wide

implementation is stifled by weak regulatory frameworks, high cybersecurity risks, low public

interest, and limited awareness (Boubaker & Zammel, 2025). As an illustration, Al Saraya

Bank's exclusion from the One Pay network showcases the lack of interoperability among

banks and resides within a digital services delivery (Hussainey & Dalwai, 2024). In addition,

a large informal economy significantly affects Libya's financial system; around 20% of cash

will be outside the financial system by 2024 (Boubaker & Zammel, 2025). If these challenges

to adoption and integration are not solved, Libya is at risk of deepening financial exclusion and

perennially stagnating its economy.

The research conducted on FinTech's effect on enhancing the quality of banking services and

assisting with financial inclusion in places with developed financial systems like Morgan

(2022) and Danladi et al (2023) is lacking when it comes to conflict-ridden or fragile

economies, Libya for example. To illustrate, Wachira and Njuguna (2023) showed how the M-

Pesa mobile money system in Kenya improved financial inclusion which aided in mitigating

poverty levels. In the same manner, Santhosh Kumar and Aithal (2024) showed how FinTech

start-ups in India began providing microloans and savings schemes to people from low-income

households using digital platforms. Furthermore, in sub-Saharan Africa, it was reported by

Ashenafi and Dong (2022) that the use of FinTech has been linked to lowered income

inequality in conjunction with enhanced access to credit for low-income groups.

Despite efforts such as the EU-sponsored E-nable project that aims to build a digital finance

framework for Libya by 2025, the results remain unassessed, creating a significant research

gap (EU, 2025). Without these assessments, Libya's policymakers are left without means to

construct strategies based on FinTech innovations that could drive the country's economic

153

Journal of Islamic Economic Laws Vol. 8 No. 2, 2025

10120717/5001110102110070

recovery. Even though a number of studies have identified various cultural, regulatory, and

technological barriers to e-banking in Libya (Alnaas, 2021), none have explored the impact of

FinTech on the banking service quality and financial inclusion of the users. This research seeks

to examine the potential of FinTech to transform banking services in Libya and broaden their

accessibility to unserved populations.

The foundation of this study relies on the theoretical framework of the Innovation Diffusion

Theory (IDT). Rogers (1983) developed the theory, which describes how innovation is adopted

in a certain society and provides useful information regarding the process of change. It accounts

for motivation to adopt innovation technology constructs as models for executing various

activities.

According to Rogers (2003), innovation is defined as an idea, practice, or an object that an

individual or unit of adoption considers new. This definition applies well to the banking sector,

where innovations like financial technology are altering the methods of service delivery.

Rogers notes that the "newness" aspect of an innovation does not merely relate to the time

elapsed since a certain thing was discovered, but includes alterations made to the tasks to be

performed as well as the processes used to perform them.

For example, robotics technologies such as Robotic Process Automation (RPA) are innovations

not just because they are new, but also because they give banks new means of optimizing

workflows and improving customer-facing processes (Bhatia, 2022). In this regard, financial

technology fulfills Rogers's definition of innovation because it offers benefits over traditional

banking services, including greater precision and improved speed, and so is relatively more

efficient.

The diffusion of innovation theory emphasizes any innovation needs to undergo a process of

social diffusion if it is to be adopted. This diffusion process involves reducing the uncertainty

that is associated with the innovation through communication and interactions within the

system members (Rogers et al., 2014). Rogers highlighted five attributes that influence

adoption; they include relative advantage, compatibility, complexity, trialability, and

observability. In the case of the banking industry, the adoption of Financial Technology

(FinTech) innovations offer strong relative advantages in operational efficiency and customer

satisfaction (Zhao et al., 2019). Moreover, the ease of their integration into existing banking

systems enhances their acceptance among financial institutions. Their tangible and immediate

enhancement to workflow productivity sustains accelerated adoption due to ease of testing

Journal of Islamic Economic Laws Vol. 8 No. 2, 2025 (ISSN P: 2655-9609; E: 2655-9617)

(trialability) and direct observation of claimed benefits. Innovations that conform to societal

standards and meet the customers' expectations regarding digital banking services are more

likely to be accepted. The ease with which mobile banking services spread throughout

developing countries is an example of the fact that innovations designed according to user

expectations can be widely adopted due to system compatibility and observability (David-West

et al., 2022). Thus, applying Rogers' diffusion theory allows one to comprehensively

understand the impact of financial technology on the transformation of banking service quality

alongside financial inclusion

In addition to this, capturing the adoption of online banking and other automated technologies

in Libya has received scant attention (Brydan & Abdulnabi, 2021; Almansour & Elkrghli,

2023). These studies, alongside other works of Dakduk and associates (2023), highlight the

influence of demand-side and supply-side thinking in adopting such technologies in developing

regions. It is nevertheless clear, that the use of FinTech tools to improve the quality of services

offered and the level of access to financial services in Libya is still lacking. The current analysis

aims to bridge this gap and, in doing so, attempts to prepare a guide to those in charge of the

Libyan banking sector on how best to upgrade the country's banking services through FinTech.

LITERATURE REVIEW

Financial Technology and Bank Service Quality

FinTech is transforming the banking industry with new innovations that enhance quality of

service and customer satisfaction (Josyula & Expert, 2021). In Libya, regardless of the hurdles

in the acceptance of digital financial services, there are prospects for FinTech to improve the

inefficiencies within the banking sector (Elghwail et al., 2023).

Financial technology has several components such as Alternative Payment Methods (APMs)

and automation Baker et al. (2023). APMs are defined as payment types that do not involve

cash, which are transactions made through credit or debit cards, loyalty points, money transfers,

direct debit, e-wallets, mobile platforms, local card schemes, prepaid and postpaid, e-invoices,

and even cryptocurrencies. Conversely, automation relates to work process mechanization,

which in itself equates task assignment to machines as opposed to human operators. Strategies

like robotic process automation and cognitive automation, together with others, are capable of

streamlining operational costs and improving efficiency in a multitude of locations. In Libya,

online banking is still in its early stages of acceptance, but these developments have the

Journal of Islamic Economic Laws Vol. 8 No. 2, 2025

potential to enhance customer satisfaction through technology-driven service quality

improvements.

Bouthahaba and Khaled (2021) pointed out that although Libyan banks' use of technologies

like ATMs and telephone banking, their traditional methods of doing business, still preclude

them from fully enjoying the advantages of FinTech. These studies highlight the role of

FinTech in improving the quality of services in the banking industry in Libya with regard to

ease, accessibility, and efficiency of operations.

There is substantial evidence to support the claim that FinTech improves service quality in

banking (Sharma et al., 2024; Verma, 2023). Chen et al. (2023) demonstrated that FinTech

enhances customers' financial satisfaction by lowering the interest rates on loans as well as

enabling better financial management. Murinde et al. (2022) showed FinTech's impact on the

business world as it accelerates service delivery, thus disrupting traditional business models

and achieving operational boosts of 20-30% among European banks. Al-Sowaidi and Faour

(2022) also reported that collaboration between banks and FinTech companies results in greater

innovations, allowing banks to offer more customized and timely services. It can, therefore, be

concluded that the adoption of FinTech leads to significant improvement in service quality in

various parts of the world by increasing operational ineffectiveness and meeting the changing

desires of consumers.

Theoretical frameworks, like disruptive innovation theory, help explain the impact of FinTech

on the quality of banking services offered. This is because, according to Nguyen (2022),

"disruptive innovation theory asserts that FinTech startups leverage technology to provide

services that are easier and cheaper to access, thereby competing with traditional banks."

Further supporting the argument made by Nguyen (2022) and Chen et al. (2019) also believes

that service quality and structure optimization in an organization increases transaction

affordability and thus, enhances financial services available through FinTech. This helps

explain the phenomenon on how FinTech transforms the banking service delivery system in

Libya and other parts of the world. Based on empirical evidence from Libya and other regions,

the following hypotheses are proposed:

**H1**: Bank adoption of financial technology (a)APMs (b) Automation positively impacts bank

service quality

Journal of Islamic Economic Laws Vol. 8 No. 2, 2025

Financial Technology and Financial Inclusion

As described by Polishchuk & Ishchuk (2022), financial inclusion is the access and equality

for needed opportunities to personal and business financial services such as banking, loans,

equity and insurance, within a reasonable cost and timeframe. It seeks to eliminate obstacles

that disenfranchise certain groups predisposed to financial exclusion or those who are un- and

underbanked, such as women, low-income families, and rural populations. Promoting financial

inclusion helps accelerate economic growth and reduce income disparity while empowering

vulnerable populations by equipping them with critical financial resources to manage risks,

accumulate wealth, and invest in enterprises (Lal, 2021).

In Libya, financial inclusion is still a restraining issue because of the lack of political stability,

developed financial infrastructure, and insufficient access to formal financial services. The

World Bank (2020) notes that the Libyan financial sector suffers from having two central

banks, poor governance, and documenting systems for credit information, which serve to limit

intermediation and financial inclusion. Even with these obstacles, the available opportunities

provided by digital financial services (DFS) could help accelerate financial inclusion. Other

initiatives, such as biometric identification and e-KYC, also strive to overcome some of the

structural barriers to reach the populations that have been overlooked. Such initiatives indicate

that FinTech might be able to profoundly change the landscape of the financial inclusion gaps

present in Libya.

In a global context, both Adelaja et al. (2024) and Danladi et al. (2023) have documented that

FinTech is essential for solving the problem of financial inclusion by extending low-cost and

easily-accessible services to neglected segments of the population.

Dewantoko (2025) cites examples of mobile money and digital payments as FinTech

innovations that expand the formal financial system's reach to the periphery in a more

sustainable manner than traditional banking because these systems alleviate some of the

restraints posed by the banks. In addition, newer technologies like AI credit scoring and

automated onboarding improve the ease of obtaining financial services, thereby promoting

equitable participation in economic activities (Iddrisu et al., 2025). Zhao et al. (2023) also

highlighted how FinTech allows central banks to control the credit ceiling and apply

macroprudential policies aimed at supporting lower and inclusive growth. These pieces of

research illustrate the ability of FinTech to confront fundamental obstacles to development and

bring social change for disadvantaged populations.

The two theoretical frameworks: the disruptive innovation theory and the consumer demand theory assist in analyzing the effect of FinTech on financial inclusion. Based on the theory posited by Nguyen (2022), it appears that FinTech startups operate on the concept of technology as a tool to create lower-cost solutions that provide a direct challenge to traditional banking systems. This aligns with Libya's attempts to utilize mobile wallets and eKYC systems that surge over physical branch visit requirements (Bouthahaba & Khaled, 2021). This indicates that the adoption of FinTech is aligned with user preferences towards accessibility and convenience. Based on the following hypotheses are proposed:

**H2**: Bank adoption of financial technology (a)APMs (b) Automation positively impacts financial inclusion

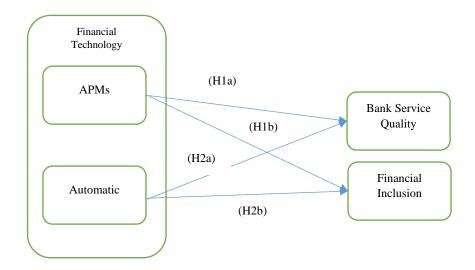

Figure 1. Conceptual Framework

#### **METHOD**

# Sampling and Data Collection

This study uses a quantitative research design to gather information from customers of banks in Libya. As a reminder from previous lessons, quantitative research is the collection and analysis of numeric data for the purpose of identifying patterns, relationships, and trends in a population. This type of research focuses on collecting objective data and employs highly structured instruments such as surveys, polls, or experiments that can yield statistically significant results (Ghanad, 2023). Participants for this study were selected through convenience sampling, meaning only those who were easily accessible and willing to complete the questionnaire were included. Participants. Data was collected using a structured

Journal of Islamic Economic Laws Vol. 8 No. 2, 2025

questionnaire which was designed on Google Forms. Despite the multilingual nature of the

region, the questionnaire was drafted in English, as it is the most universally understood

language in the area.

Measurement of Study Variables

Questions from valid and related studies were adopted, and used in developing the study

questionnaire electronically, through the Google form platform. Financial technology was

measured with two dimensions APMs and automation, both measured with five items each

from Baker et al. (2023).

Bank service quality was measured with 15 items from dimensions of tangibility,

responsiveness, reliability, assurance and empathy adopted from Mukherjee et al. (2003).

Financial inclusion adopted from Amnas et al. (2024) was measured with 5 items. The

questions seek to know if the bank strives to provide its customers with access to useful and

affordable financial products and services that meet their needs (e.g., transactions, payments,

savings, credit, and insurance) and are delivered responsibly and sustainably. All question was

measured in Five-point Likert scale ranging answers 1 for strongly-disagree to 5 strongly-

agree.

Data Analysis Procedure

The chosen methodology focuses on testing relationships between variables within the

framework of quantitative data. For rigorous statistical evaluation, the researcher relied upon

SPSS (Statistics Program for the Social Sciences) 22.0 to ensure optimum precision, accuracy,

and validity within the results obtained. The researcher established the measurement scales'

reliability and validity by performing confirmatory factor analysis (CFA) alongside the Kaiser-

Meyer-Olkin (KMO) test to evaluate sampling adequacy. These methods confirmed that the

data and the scales employed were aligned with the study objectives and sufficiently rigorous

for the intended evaluation.

To determine the relationships among varied factors, this study utilized correlation and

regression analysis, as they are well documented for assessing both linear and types of

nonlinear relationships such as exponential, polynomial, and logistic. Variable relationships

were first explored using correlation analysis (associations), and subsequently causation was

explored using regression analysis (Dufera et al., 2023). Simple effect relationships were

assessed through linear regression, whereas polynomial regression and other nonlinear models

Journal of Islamic Economic Laws Vol. 8 No. 2, 2025 (ISSN P: 2655-9609; E: 2655-9617)

DOI: 10.23917/jisel.v8i02.10073

captured the complexity of interrelationships. This enabled a comprehensive deep examination concerning the ways in which FinTech adoption affects provided banking services alongside financial inclusion.

#### **RESULTS**

# **Demographics**

Participants' demographic characteristics are summarized in the table, which describes the sample fully. It shows that, in the sample, the majority of participants were male (63%) while females were 37%. Also, there was a wide range of ages, with the largest cohort aged 26 to 35 years (31%) followed by those aged 36 to 45 years (27%). Regarding marital status, married individuals represent the highest group (44%) in comparison to those who identify as single (38%). Most participants reported holding at least a Bachelor's Degree (51%), followed by Master's Degrees (23%). These demographic characteristics help to gauge the level of sample representativeness and to analyze the study's findings relative to the objectives within the research framework

Table 1. Demographic Profiles of the Respondents

## Reliability and Validity of Construct

The Kaiser-Meyer-Olkin (KMO) measure of sampling adequacy provides an index between zero and one. An index of one is achieved when each variable is perfectly predicted without error by reproducing how the other variables are predicted (under 0.5 is unacceptable). This data's KMO index was 0.895 (In Table 1) which is considered 'meritorious' (Hair et al., 1998). Bartlett's test produced significant chi-square results (4835.169) with 435 degrees of freedom and a significance value of p<0.000. Reliability statistics and mean and standard deviation of items grouped under four constructs: APM, Automation, Bank Service Quality and Financial Inclusion are presented in Table 3. Cronbach's alpha values for each construct ranging from 0.716 to 0.920 indicates good internal consistency across items (Izah et al., 2023).

With regards to each item's factor validity, average to better than 0.5 with most individual item factor loadings being greater than 0.5 (Tavakol & Wetzel, 2020). The mean scores and standard deviations indicate that responses are variable, with Automation having higher mean values and lower variability than other constructs such as Financial Inclusion (e.g., FI1: mean) demonstrating differences in participant perceptions across measured dimensions.

# Correlation Analysis

In Table 4, although the dependent variable is not mentioned, the description summarizes its components as focus unit APM, Automation, Bank Service Quality, and Financial Inclusion. The correlations reveal the enhancement of these variables is associated through significant positive relationships. Concerning APM, it is moderately correlated with BSQ (0.420, p<0.000) and FI (0.326, p<0.001), indicating that higher automation of processes is linked to greater

Journal of Islamic Economic Laws Vol. 8 No. 2, 2025

bank service quality and financial inclusion. Automation also has significant correlations with BSQ (0.467, p<0.000) and FI (0.301, p<0.000), signifying that more of what is considered automation enhances service quality and financial inclusion.

Moreover, the correlation between BSQ and FI (0.334, p<0.000) strengthens the argument regarding the relationship these constructs have with one another. All in all, the relationships reveal that improvement in one area is likely to enhance others, thereby illustrating synergy among the variables in question.

Table 4. Correlation Coefficient of Independent Variables and Dependent Variable

	APM	AU	BSQ	FI
APM	1			
AU	.214**	1		
	.000			
BSQ	.420**	.467**	1	
	.000	.000		
FI	.326**	.301**	.334**	1
	.00	.000	.000	

<sup>\*)</sup> significant at a real rate of 10%

## Hypothesis Testing

The results from the regression analyses investigating the associations between different independent and dependent variables are contained in Table 5. It shows the values of  $R^2$  and adjusted  $R^2$ , standardized beta coefficients, t-values, and level of significances for each path. Importantly, Automated Process Management to Bank Service Quality (BSQ) and Automation to Financial Inclusion as well as AU to BSQ have statistically significant positive relationships. For example, APM predicts BSQ at a beta of 0.420 (t = 8.112, p<0.000), explaining 17.3% of the variance in BSQ. AUC also significantly predicts FI (beta = 0.301, t = 5.982, p<0.000) and BSQ (beta = 0.467, t = 9.263, p<0.000) where the prediction of BSQ accounted for 21.5% of the variance. The BSV model is supported by the collinearity diagnostics which show no multicollinearity problems since tolerances are 1.000 and VIFs of 1.000 for all paths (Hair et al., 2018).

#### DISCUSSION

The purpose of this study is to examine the impact of financial technology on advancing banking services and promoting financial inclusion in Libya. As such, the results of the examination, which confirm Hypothesis one and Hypothesis two, can be explained using the Innovation Diffusion Theory. IDT accounts for the adoption of new technologies over time and highlights factors such as relative advantage, compatibility, and observability as primary contributors. In regard to Hypothesis 1, the adoption of fin tech innovations including the Automated Process Management and Automation is consistent with the theory's focus on relative advantage. APM and AU greatly improve operational functions, for example, efficiency, error reduction, and customer service interactions with banking systems. This agrees with Sharma et al. (2024) demonstrated that innovations like internet banking lower marginal cost increases in service provision, resulting in an S-shaped diffusion curve associated with banks adopting these technologies over time. Equally, Chen et al. (2019) confirmed relative advantage significantly affects attitudes toward the adoption of fintech services and validated the importance of technology-enabled service improvements of enhanced value.

Financial technologies like APM and AU significantly influence financial inclusion as per IDT principles, supporting Hypothesis two. The theory's compatibility component is exemplified by automation in mobile banking services and artificial intelligence credit evaluations, which alleviate barriers to financial services (Baker et al., 2023). Adelaja et al. (2024) describes mobile banking's role in reducing access barriers for rural users, further noting lesser dependency on bank branches. This observation corroborates Rogers' (2003) claim regarding the role of compatibility in the diffusion of innovations. Moreover, this corroborates Danladi et al.'s (2023) finding on service responsiveness within fintech frameworks enhanced by diversified customer needs and efficiency, reinforcing the importance of observability driving

Journal of Islamic Economic Laws Vol. 8 No. 2, 2025

adoption. These findings relate to other diffusion models whose assumptions are based on

technological advancements and demand changes (Nguyen, 2022). Altogether, IDT offers a

comprehensive explanation on how APM and AU enhance the quality of services offered by

banks and deepen servicing gaps alongside emerging access barriers with diminished standards

of financial inclusion.

The outcomes of this banking study shed light on the practical functions within the banking

industry. To begin, the implementation of Automated Process Management and Automation

technologies has the potential to redefine bank operational workflows, resulting in heightened

efficiency and precision (Baker et al. 2023). Routine activities, including loan processing,

account management, and transaction processing, can be automated by the banks which will

streamline workflows, reduce errors, and improve attestation to compliance benchmarks. In

addition, automation enhances staff deployment in banks, allowing them to devote more

attention to value enhancing activities, which strategically improves customer interactions. In

the context of banking services, these improvements elevate service standards and reinforce

the competitive stance of banks in the context of the digital ecosystem in which the banking

industry operates. This helps to support initiatives like the EU-sponsored E-nable project aim

to build a digital finance framework for Libya.

Second, the study shows how APMs and AUs enable financial inclusion by easing banking

services for the unserved customers. Automation makes possible the digital onboarding of

customers, the AI assessment of creditworthiness, and mobile banking systems that lessen the

need for reliance on physical locations (Adewumi et al., 2024). Such technologies allow banks

to provide customized scalable solutions to low income and rural areas that have been

traditionally underserved, expanding the frontier of financial inclusivity. For instance,

automated systems streamline account creation and the approval of loans, at the same time

ensuring compliance with the Community Reinvestment Act (CRA) that promotes access to

financial services. Bankers stand to gain by using automation to extend their business and

improve service delivery; in so doing, they advance financial inclusion while fueling growth

in these underserved markets.

As important as this study's contributions are, it has limitations. To begin with, the use of cross-

sectional data prohibits the examination of any potential changes over time or any causative

relationships that may exist between the different variables in the context of time. This renders

capturing the full extent of the impact of integrating technology into banking processes on the

Journal of Islamic Economic Laws Vol. 8 No. 2, 2025

banking outcomes elusive. Also, the primary focus of the study is on the quantitative aspects

of the data which fails to capture the subtleties concerning the qualitative dimension of how

automation affects the level of service and financial inclusion. Certain customer perceptions or

problems that members of the underserved segments experience may not be captured in the

data.

Another possible shortcoming includes selection bias for the sample. It is possible that some

banks or regions were omitted from the study, limiting its scope. Additionally, the study does

not consider the possible cost, regulatory, or employee-driven APM and AU implementation

barriers. Understanding these factors is vital to assessing the actual technological adoption

domain in the banking industry. Lastly, the impact of varying automation technologies, such

as AI, on service quality and financial inclusion requires deeper exploration. Meeting these

limitations could enhance the insights on automation's impact on banking services.

**CONCLUSION** 

The empirical findings of this investigation demonstrate that the implementation of Automated

Process Management (APM) coupled with system-wide Automation (AU) within Libyan

banking institutions leads to marked gains in service efficiency and measurable advances in

financial inclusion. The statistical corroboration of the articulated hypotheses affirms the

predictive capacity of the Innovation Diffusion Theory and indicates that the deployment of

fintech innovations not only streamlines core operational processes but also lowers barriers to

access for previously excluded demographics. Such outcomes afford scholarly confirmation

that technology adoption can recalibrate banking configurations and substantiate inclusion

programmes within the context of developing economies, thereby underpinning both

theoretical discourse and applied extension.

Notwithstanding, critical limitations must be circumscribed, since they condition the

interpretation of the empirical results. The research employs a cross-sectional framework, thus

eschewing inferences of binding causation, and the explicit confinement to the Libyan banking

sector circumscribes extrapolative validity to alternative geographical or industrial settings.

Furthermore, the primary reliance upon quantitative indicators evades a more layered

comprehension of the socio-cultural determinants that mediate fintech adoption. Collectively,

these constraints counsel a subsequent scholarly agenda that foregrounds longitudinal research

Journal of Islamic Economic Laws Vol. 8 No. 2, 2025

DOI: 10.23917/jisel.v8i02.10073

designs and integrates mixed-method triangulation, thereby enriching the evidentiary base and safeguarding the validity of future conclusions.

The authorship of this study has illuminated the multifaceted difficulties endemic to the production of disciplined academic inquiry, especially within the nascent domain of financial technology in low-and-middle-income contexts. Scholars and postgraduate researchers contemplating parallel investigations ought to allocate sufficient temporal margins for the sequential phases of outlining, peer-feedback uptake, and substantive revision so that the final document achieves the requisite rigour and clarity. The study aspires to function as an initial anchor for subsequent, more granular investigations that map the confluence of technological advance, financial intermediation, and socioeconomic inclusion, thereby enhancing both the durability of scholarly argument and the evidentiary base for policy formulation in jurisdictions confronting expansive digital transformation.
